Students at the undergraduate & postgraduate levels and Research Scholars will be given this edited book with the expectation that it will supply them with a correct and easy grasp of the fundamental overview of the environment and sustainable development.

Our understanding of the environment and sustainable development has significantly advanced as a result of the vast amount of work that scientists in these domains have done. This book aims to introduce new boundaries in terms of a fundamental overview of the environment and sustainable development as practical approaches for addressing environmental issues.

The process of attaining human development goals while maintaining the capacity of natural systems to continue providing the natural resources and ecosystem services upon which the economy and society depend is referred to as sustainable development. The idea of 'needs,' in particular, the essential needs of the world's poor, to which overriding priority should be given, and the idea of limitations imposed by the state of technology and social organization on the environment's ability to meet present and future needs are both contained within it. It is important to note that the concept of 'needs,' in particular, the essential needs of the world's poor, to which overriding priority should be given.

The chapters cover various topics relating to sustainable development and human interaction with the natural environment. In light of recent work and the most recent information that is obtainable from various sources, a concise and exhaustive synopsis has been developed as a result.

The authors would like to take this opportunity to extend their gratitude to their coworkers at various institutions and universities located all over the country. These individuals have greatly assisted them by providing them with priceless advice while they were putting together this Endeavor. Finally, my deepest gratitude goes out to each of the contributors to this book; without their assistance, the publication of this volume would not be possible.

It would be very appreciated if you could offer some suggestions to improve the book.

Dr. Nithar Ranjan Madhu
&
Dr. Biplab Kumar Behera

Contents

Chapters and Authors		Pages
Chapter -1	Application of biofertilizers in polyculture: a way towards sustainability Biplab Bhowmik, Bipasa Dey and Riya Mondal	1-17
